

Next steps when your child has received a diagnosis

Autism spectrum disorder

Early diagnosis and treatment can make a big difference in how likely it is that your child can build the skills that may help them become self-sufficient.¹

Applied behavior analysis (ABA) therapy can help. ABA uses behavioral principles to teach children with autism numerous life skills and behaviors they may otherwise not learn on their own.

- Your health plan has an expanded ABA benefit
- Pre-certification is required (if your child has already been diagnosed with autism spectrum disorder (ASD) and is receiving treatment, your provider may already be approved)

With ASD, it's never too soon to learn about services that can help. Services that can help you, your child and whole family live happier and healthier lives.
